

Aminoc

Description

Agzyme is a soil stabilizer and rehabilitation agent. Tailored biology is a major advancement in soil rehabilitation. Rapid mesh-like roots establish both seeds and crust to the soil, interlocking to any soil profile. It protects the soil from salinity and heavy metals. Increases the soil stability and reduces water and fertiliser requirements.

Key Benefits

- Rapid root establishment
- Extremely high germination rate
- Increase dust suppression
- Ongoing remediation activity

Application

- Site contamination: 10KG per hectare
- High Salinity: 5KG per hectare
- Site preparations, dust suppression and land divisions: 1KG per hectare
