

Stabilise your roads and open areas with DustJel

Reduced soil erosion • Road stabilisation • Easily transported for occasional use • Easy to apply through our in-house built dosing system • Easily mixed with water • Short term dust suppressant

What is DustJel?

DustJel is a concentrated polymer liquid dispersion, a water extender. Its main use is to stop dust on trafficable areas. It is non-toxic to flora and fauna, biodegradable and an environmentally friendly product. DustJel can be used on open areas as well but Rainstorm provides more affordable solutions.

DustJel is easy to apply, very cost effective and safe to use. It can be applied at any time during the year. It works best on roads in combination with our other product, DustMag.

Benefits of DustJel

It will stabilise the road surface on both haul and access roads by binding road base particles together. That reduces the need for water up to 60%.

It is a short term solution to prevent wind erosion on open areas or stockpiles.

How long will it last?

When used on roads, DustJel is applied in extremely small doses so it needs to be reapplied a few times per day.

On open areas DustJel can last up to a month.

Application

DustJel is added to the water cart as part of an ongoing dust management plan. It can be applied at a ratio as low as 1L per 50,000L of water

With the addition of Rainstorm's in-house designed and build dosing systems, application couldn't be simpler. It is set up to feed the DustJel through your standpipe at the required dosing rate. Contact your Rainstorm representative for more information.

Pricing

DustJel is supplied in 1000L IBC's. It is priced by the litre as a delivered product. The dosing systems is available on an annual lease and comes with on-site servicing.
